

**Supplementary material**

Appendix 1.

Number of calls in first minute lower than in second minute post-stimulus

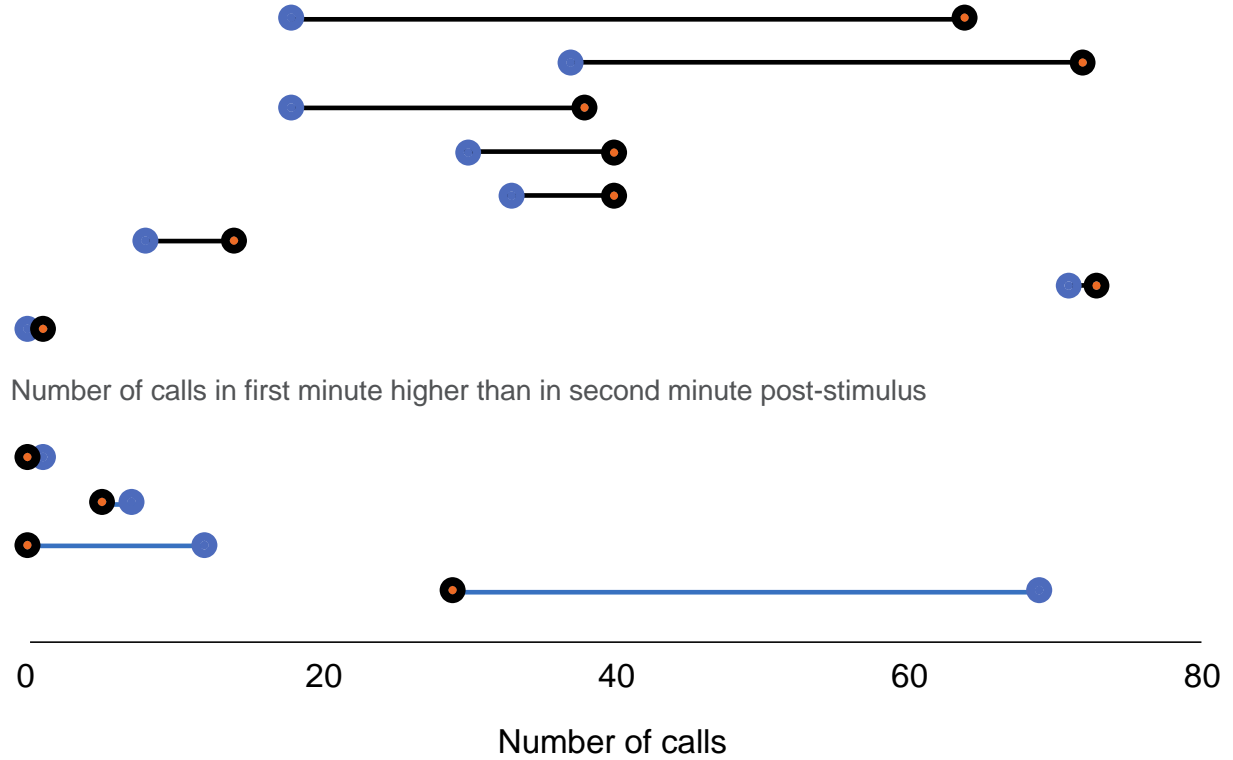

Figure A1. Number of short calls given by each group in the first two minutes following presentation of the thornbill alarm call. Counts are presented for each group separately. Number of short calls given during the first minute is indicated by the blue dots, and number given during the second minute by the black dots. The top eight groups called fewer times in the first minute compared to the second, and the bottom four groups called more times in the first minute.

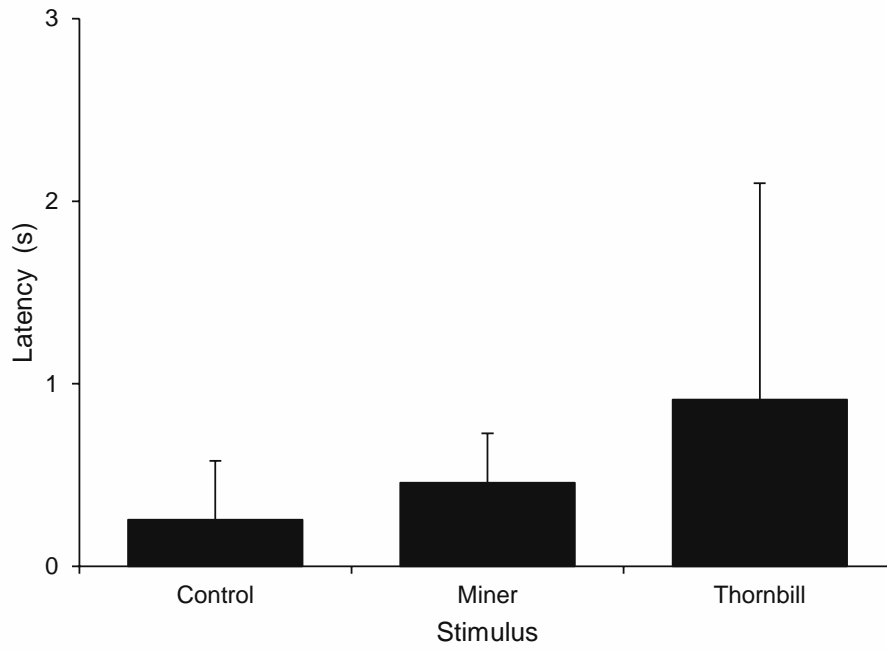

Figure A2. Average latency to start a scan bout post-stimulus for each treatment. Error bars show standard error. Sample sizes are as follows: Control  $n = 8$ ; Miner  $n = 13$ ; Thornbill  $n = 7$ .
